TITLE : COMMUNICATION UNIT AND METHOD
PROVIDED WITH PACKET
ACKNOWLEDGMENT

ABSTRACT : PROBLEM TO BE SOLVED: To improve the data transmission efficiency on a wide-range conditions in a packet data communication system.

SOLUTION: A communication unit is provided with a packet re-divider and an error detection code generator which can be operated for a data packet 200. A NAK including an error detection code corresponding to sub-parts 202 to 205 of the packet from the packet re-divider is generated to request retransmission of sub-parts of the packet. In a unit on the transmission side, the error detection code is calculated for each sub-part. A second error detection code calculated for each sub-part is compared with a received first error detection code corresponding to the sub-part. A sub-part for which corresponding error detection codes do not match is discriminated as a bad sub-part 204 and is transmitted again.
